20. ABSTRACT (Continue on reverse side if necessary and identify by block number)
This report provides information and analysis on the physical condition of the dam as of the report date. Information and analysis are based on visual inspection of the dam by the performing organization.

The examination of documents and visual inspection of the Cobleskill Upper Reservoir Dam and appurtenant structures did not reveal conditions which constitute a hazard to human life or property.

DD FORM 1 JAN 73 1473 EDITION OF 1 NOV 65 IS OBSOLETE

393970

SECURITY CLASSIFICATION OF THIS PAGE (When Data Entered)

The discharge capacity of the spillway is inadequate for all storms in excess of 57% of the Probable Maximum Flood. During the 1/2 PMF event, the maximum water surface elevation will be 0.33 feet below the top of dam. The dam will be overtopped by 0.28 feet during the full PMF; therefore, the spillway is assessed as "Inadequate".

PREFACE

This report is prepared under guidance contained in the Recommended Guidelines for Safety Inspection of Dams, for Phase I Investigations. Copies of these guidelines may be obtained from the Office of Chief of Engineers, Washington, D.C. 20314. The purpose of a Phase I Investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation, and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I Investigation; however, the investigation is intended to identify any need for such studies.

In reviewing this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. In cases where the reservoir was lowered or drained prior to inspection, such action, while improving the stability and safety of the dam, removes the normal load on the structure and may obscure certain conditions which might otherwise be detectable if inspected under the normal operating environment of the structure.

It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through frequent inspections can unsafe conditions be detected and only through continued care and maintenance can these conditions be prevented or corrected.

Phase I inspections are not intended to provide detailed hydrologic and hydraulic analyses. In accordance with the established Guidelines, the Spillway Test flood is based on the estimated "Probable Maximum Flood" for the region (greatest reasonably possible storm runoff), or fractions thereof. Because of the magnitude and rarity of such a storm event, a finding that a spillway will not pass the test flood should not be interpreted as necessarily posing a highly inadequate condition. The test flood provides a measure of relative spillway capacity and serves as an aide in determining the need for more detailed hydrologic and hydraulic studies, considering the size of the dam, its general condition and the downstream damage potential.

TABLE OF CONTENTS

PHASE I INSPECTION REPORT
NATIONAL DAM SAFETY PROGRAM

Name of Dam:	Cobleskill Upper Reservoir Dam
State Located:	New York
County:	Schoharie
Watershed:	Mohawk River Basin
Stream:	Smith Brook (tributary of Cobleskill Creek and Mohawk River)
Date of Inspection:	October 30, 1980

ASSESSMENT

The examination of documents and visual inspection of the Cobleskill Upper Reservoir Dam and appurtenant structures did not reveal conditions which constitute a hazard to human life or property.

The discharge capacity of the spillway is inadequate for all storms in excess of 57% of the Probable Maximum Flood. During the 1/2 PMF event, the maximum water surface elevation will be 0.33 feet below the top of dam. The dam will be overtopped by 0.28 feet during the full PMF; therefore, the spillway is assessed as "Inadequate".

The following problems were observed which require remedial action within one year of notification to the owner:

1. Joints in the spillway must be cleaned and recaulked.
2. The voids under the riprap spillway channel must be investigated and backfilled or grouted.
3. Remove the trees and brush growth from the embankment and around the spillway. Provide a program of periodic cutting and mowing of these surfaces.
4. Provide a program of periodic inspection and maintenance of the dam and appurtenances. Document this information for future reference.
5. An emergency action plan must be developed.

I.D. No. NY 656 DEC No. 174A - 3138B
MOHAWK RIVER BASIN
SCHOHARIE COUNTY, NEW YORK

SECTION 1: PROJECT INFORMATION

1.1 GENERAL

a. Authority

The Phase I inspection reported herin was authorized by the Department of the Army, New York District, Corps of Engineers, to fulfill the requirements of the Nation Dam Inspection Act, Public Law 92-367.

b. Purpose of Inspection

Evaluation of the existing conditions of the subject dam to identify deficiencies and hazardous conditions, determine if they constitute hazards to human life and property and recommend remedial measures where necessary.

1.2 DESCRIPTION OF PROJECT

a. Description of Dam and Appurtenances

The Cobleskill Uper Reservoir Dam consists of a 2200 feet long homogenous earth embankment, with a compacted core trench to an impervious layer. One leg of the embankment follows the shore line of the Cobleskill Lower Reservoir with 90^{0} bend around a water supply intake the other leg stretches across Smith Brook. The upstream slope of the embankment is protected with stone. The spillway is a concrete overflow section discharging onto a sloped concrete apron and riprapped channel. There is a 12" drain located through the highest portion of the embankment across Smith Brook. It is a cast iron pipe with a concrete gate tower at the dam crest just west of the spillway. The embankment is approximately 30 feet high at its highest point across Smith Brook.

b. Location

The dam is located on Smith Brook, a tributary of Cobleskill Creek and Mohawk River approximately 2.0 miles southeast of Cobleskill, New York.

c. Size

The dam is 30 feet high and impounds 239. acre feet at normal pool elevation. Therefore, it is classified as "small" in size (less than 40 feet in height.)

d. Hazard Classification

The dam is classified as high hazard due to its location above several homes in Mineral Springs, NY. The reservoir is also a major part of the Cobleskill, NY water supply system.

e. Ownership

The dam is owned and operated by the Village of Cobleskill, New York, 12093. Mr. John Barber, Water Supervisor, Village of Cobleskill, Cobleskill, New York, was the contact with the Village, he can be reached at (518) 234-2195.

f. Purpose of the Dam

The dam provides storage for the Cobleskill water supply.

g. Design and Construction History

The dam was constructed in 1967 according to the design of and under the direction of James S. Van Deusen, P.E. Cobleskill, New York. The original application for permit was filed in 1963 but funding held up start of construction 4 years.

h. Normal Operating Procedures

Water releases from the Cobleskill Upper Reservoir are normally through the intake and into the water supply either directly or through the lower reservoir. Any excess flow goes through the uncontrolled spillway.

1.3 PERTINENT DATA

a. Drainage Area (sq. mi.)	1.26

h. Spillway

Type: Concrete overflow section. Concrete apron and riprap discharge channel.

Weir length (ft): 41.0

i. Reservoir Drain
Type: 12" cast iron pipe, with gate tower at crest of dam.

Maximum Capacity (cfs). 20.00

SECTION 2: ENGINEERING DATA

2.1 GEOLOGY

The Cobleskill Upper Dam is located in the glaciated potrion of the Appalachian Uplands (northern extreme of the Appalachian Plateau) physiographic privince of New York State. These uplands were formed by the dissection of the uplifted but flat lying sandstones, siltstones and shales of the Lower and Middle Devonian Period (395 to 365 million years ago). The plateau surface is represented by flat-topped divides with drainage generally southward. Drainage in the vicinity of the dam is northward toward the Mohawk River.

Glacial covere is generally thin, the deposits of which have resulted from glaciations during the Wisconsin glaciation, approximately 11,000 years ago.

The "Preliminary Brittle Structures Map of New York" prepared by Yngvar W. Isochsen and William G. McKendree (dated 1977) indicates the presence of a subsurface fault, showing relative movement as inferred from drill hole data, and a topographic linear feature observed on one or more of the following: topographic map, Landsat (ERTS), Skylab, or U-2 photographic product, within the drainage area of the reservoir.

2.2 SUBSURFACE INVESTIGATION

Two borings were located for the design of the dam. These explorations indicate that the soils encountered are varying mixtures of clay, silt, sand, and gravel with boulders, of glacial till origin. No water table is indicated.

2.3 DAM AND APPURTENANT STRUCTURES

The dam was erected in 1967 under the supervision of James S. Van Deusen, P.E. Cobleskill, NY.

2.4 CONSTRUCTION RECORDS

No construction records are available.

2.5 OPERATION RECORDS

All operation records are maintained at the treatment plant below the Lower Dam.

2.6 EVALUATION

The data presented in this report has been compiled from information obtained from Mr. John Barber, Water Supervisor, Village of Cobleskill, NY, and the New York State DEC files. This information appears adequate and reliable for Phase I Inspection purposes.

SECTION 3: VISUAL INSPECTION

3.1 FINDINGS

a. General

Visual inspection of the Cobleskill Upper Reservoir Dam and watershed was conducted on October 30, 1980. The weather was cloudy and the temperatures ranged in the thirties. The reservoir level at the time of inspection was approximately 5. feet below the spillway crest.

b. Embankment

The embankment shows no signs of distress and appears to be in good condition. All slopes seem to be stable with no erosion or depressions. However, the embankment is in need of maintenance, there is tree and brush growth on both slopes. The upstream riprap is generally in good shape but the trees and brush will begin to displace it, if left unattended to. The crest is in good condition. No evidence of seepage was found on the embankment or beyond the downstream toe. Low reservoir elevation at the time of inspection may have reduced the possibility of finding seepage, however, there were no other factors pointing to seepage problems. The discharge channel of the reservoir drain is in need of small tree and brush removal.

c. Spillway

The concrete spillway is in good condition but also in need of some minor maintenance. All joints in walls and floor slabs must be cleaned out and recaulked.

d. Downstream Channel

The riprapped channel is in need of further investigation, several voids were found under the grouted stone in the lower end of the channel. See photo # 6. There is also some brush and tree growth along the channel which must be cleared.

e. Reservoirs

No sediment or problems were reported within the reservoir area.

f. Appurtenant Structures

Both the reservoir drain and the lines to the water system are all reported to be operational. The concrete intake wells appeared to be in very good condition.

3.2 EVALUATION OF OBSERVATIONS

The problem areas boserved during the inspection and the recommended remedial measures are as follows:

1. Joints in the concrete spillway are full of debris and vegetation is growing in them. They must be cleaned out and recaulked.

2. There are voids under the rip rapped spillway channel. This problem must be investigated further to determine the extent of undermining and backfilled or regrouted.

3. Both the embankment and channel have tree and brush growth which must be removed. Provide a program of periodic cutting and mowing of the embankment and areas adjacent to the spillway.

4. Provide a program of periodic inspection and maintenance of the dam and appurtenences including yearly operation and lubrication of all gates and valves. Document this information for future reference.

5. Develop an emergency action plan for notification of downstream residents and the proper governmental authorities.

SECTION 4: OPERATION AND MAINTENANCE PROCEDURES

4.1 PROCEDURES

The normal water surface elevation is approximated by the crest of the spillway. Discharges can be to the treatment plant, lower reservoir, low level drain or over the spillway.

4.2 MAINTENANCE OF THE DAM

Maintenance of the dam is provided by the owner, the Village of Cobleskill, NY. Maintenance is not considered satisfactory as evidenced by the tree and brush growth on the embankment and deterioration of the spillway joints.

4.3 WARNING SYSTEM

There is no warning system in effect or in preparation.

4.4 EVALUATION

The dam and appurtenances are in need of maintenance. The areas sited are noted in "Section 3: Visual Inspection".

SECTION 5: HYDRAULIC/HYDROGOGIC

5.1 DRAINAGE AREA CHARACTERISTICS

The Cobleskill Upper Dam is located on Smith Brook, adjacent to the Lower Reservoir. Smith Brook has a drainage area of 1.26 square miles at the site and is a tributary of Cobleskill Creek and Mohawk River. The watershed is primarily wooded with some pasture in the lower, flatter portions. The cover is glacial till and generally thin.

5.2 ANALYSIS CRITERIA

The analysis of the spillwya capacity of the dam and storage of the reservoir was performed using the Corps of Engineers HEC-1 computer model. The unit hydrograph was defined by the Snyder Synthetic Unit Hydrograph method, and the Modified Puls routing procudure was incorporated. The Probable Maximum Precipitation (PMP) was 19.5 inches (24 hrs., 200 sq. miles) from Hydrometeorological Report #33 in accordance with the recommended guidelines of the Corps of Engineers. Several floods (%'s of the Probable Maximum Flood (PMF) were selected for analysis. The full (PMF) inflow of 2273. cfs was routed through the reservoir and found to produce an outflow of 2271 cfs.

5.3 SPILLWAY CAPACITY

The spillway is a 42.5 feet wide uncontrolled concrete section with a 1.5 feet thick pier leaving 41 feet of weir length. The crest elevation is 1180.55 U.S.G.S. with a maximum flow height of 4. feet before overtopping occurs. The maximum flow is 1195. cfs before overtopping.

5.4 RESERVOIR CAPACITY

The reservoir at the crest of the spillway, and at the top of the dam are 239. acre feet and 353 acre feet respectively. Surcharge, storage between spillway and top of dam is equivalent to 1.70 inches of runoff from the watershed area.

5.5 FLOODS OF RECORD

There are no gaging stations located on or near the dam site nor are there any accounts of high flows or levels.

5.6 OVERTOPPING POTENTIAL

The maximum capacity of the spillway before overtopping occurs is 1195 cfs, which is 57% of the routed PMF inflow of 2273 cfs. The dam is overtopped by 0.28 feet during the full PMF event.

5.7 EVALUATION

The spillway of the Cobleskill Upper Reservoir will handle 57% of the PMF. Based on the Corps of Engineers screening criteria it is considered inadequate.

SECTION 6: STRUCTURAL STABILITY

6.1 EVALUATION OF STRUCTURAL STABILITY

a. Visual Observations

No signs of major distress were observed in connection with the earth embankment. The gate house and spillway both appeared to be in generally good condition.

b. Design and Construction Data

No information could be located concerning the structural stability of the embankment portion of the dam.

c. Post Construction Changes

No post construction changes have been initiated.

SECTION 7: ASSESSMENT/RECOMMENDATIONS

7.1 ASSESSMENT

a. Safety

The Phase I Inspection of the Cobleskill Upper Reservoir Dam revealed that the spillway is "Inadequate" based upon the Corps of Engineers screening criteria. The dam will be overtopped by all storms in excess of 57% of the PMF. The embankment appears stable with few minor maintenance problems.

b. Adequacy of Information

The information reviewed is considered adequate for Phase I Inspection purposes.

c. Need for Additional Investigation

The only additional investigation required is that of the voids under the spillway channel. Once the degree of undermining is determined the best solution can be applied.

d. Urgency

The areas listed below requiring remedial action should be initiated within 3 months and completed within 1 year of notification to the owner.

7.2 RECOMMENDATIONS

1. Clean out and recaulk the joints in the spillway.

2. The voids under the riprapped spillway channel must be investigated and repaired.

3. Remove the tree and brush growth from the embankment and around the spillway.

4. Provide a program of periodic inspection and maintenance of the dam and appurtenances. Document this information for future reference.

5. An emergency action plan must be developed.
